FIG. 12

FIG. 13

Superimpose a sub-frame with a long light emission period onto the time of a sub-frame with a short light emission period to allow transmission at the same time as adjacent pixels

FIG. 14

Since this process entails picture quality deterioration, the process is performed only in areas which are not noticeable when viewed by a person

- Portion near edge of image
- Portion with low degree of attention in a saliency map (portion with low luminance, portion with minimal edge, portion with minimal motion)

(b)

FIG. 15

Instead of causing light emission in non-consecutive sub-frames, move time of sub-frame to cause continuous light emission

FIG. 16

FIG. 17

Since signal superimposing causes darkening, extend light emission time up to adjacent sub-frame so that average brightness is the same

(b)

Since signal superimposing causes darkening, cause light emission in a different sub-frame so that average brightness is the same
