Abstract

The invention relates to a technique for especially testing an IEEE 802.11 WLAN device, in particular for testing performance compliance of the device. According to a method aspect to be performed by a test system, exchange (300) of an ICMP message pair (302, 308) is initiated between the device under test (DUT) and the test system; and a backoff time (306) selected by the DUT during the message exchange is determined.
