ABSTRACT

A filing sheet for accommodating sheet pieces capable of being used for an album for accommodating photographs, postcards, and the like in a series. The filing sheet has a bag-like film (11) covering a fixed area of a filing sheet forming paper (10) on one side thereof, such that photographs (P1 to P4) or postcards (PC1, PC2) can be accommodated in a gap between the filing-sheet forming paper (10) and the film (11). Areas for accommodating the photographs are formed by heat-sealed portions (20 to 27) for connecting the obverse and reverse portions of the film (11) at a plurality of positions. The heat-sealing area of the heat-sealed portion (20) is set to be larger than that of each of the other heat-sealed portions (21 to 27) to effectively prevent the separation of the obverse and reverse portions of the film (11) which is liable to occur when the photograph (P4) is inserted and removed.
