(54) Title: CELL RE-SELECTION IN A CELLULAR TELECOMMUNICATIONS NETWORK

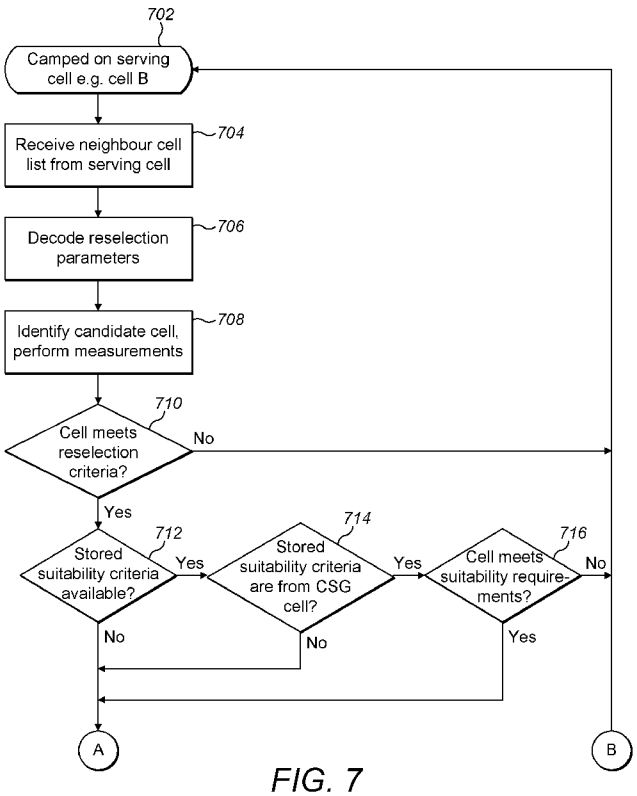

FIG. 7

(57) Abstract: According to an aspect of the present disclosure, there may be provided a method in a wireless cellular telecommunications device camped on a serving cell, the device storing a first parameter obtained from system information of a first cell. The method comprises: measuring an attribute of a signal received from a candidate cell; determining if the candidate cell is a closed subscriber group cell; and, evaluating the candidate cell for re-selection. If the candidate cell is determined to be a closed subscriber group cell, the evaluation of the candidate cell for re-selection is based on at least the measured attribute irrespective of the first stored parameter, said first stored parameter indicating a minimum value for the measured attribute. Additionally, or alternatively, if the candidate cell has an identifier equivalent to an identifier of the first cell, the evaluation of the candidate cell for re-selection is based on at least the measured attribute and the stored parameter, else the evaluation of the candidate cell for re-selection is performed without using the stored parameter. A device and computer readable medium are also provided.
