

COMPOUNDS AS MODULATORS OF ROR GAMMA

BACKGROUND OF THE INVENTION

1. TECHNICAL FIELD

The present invention relates to novel compounds which modulate the activity of ROR γ and their use as medicaments.

2. BACKGROUND INFORMATION

ROR γ (retinoic acid receptor related orphan receptor gamma) (also referred to as “ROR γ t”) is a transcription factor belonging to the steroid hormone receptor superfamily (reviewed in Jetten 2006. *Adv. Dev Biol.* 16 : 313-355.). ROR γ has been identified as a transcriptional factor that is required for the differentiation of T cells and secretion of Interleukin 17 (IL-17) from a subset of T cells termed Th₁₇ cells (Ivanov, *Cell* 2006, 126, 1121-1133). The rationale for the use of a ROR γ targeted therapy for the treatment of chronic inflammatory diseases is based on the emerging evidence that Th₁₇ cells and the cytokine IL-17 contribute to the initiation and progression of the pathogenesis of several autoimmune diseases including psoriasis, ankylosing spondylitis, rheumatoid arthritis, multiple sclerosis and Crohn’s disease (reviewed in Miossec, *Nature Drug Discovery* 2012, 11, 763-776; see also Khan et al., *Bioorganic & Medicinal Chemistry Letters* 23 (2013), 532-536). The outcome of recent clinical trials with neutralizing antibodies to IL-17 and its receptor IL-17RA (Leonardi 2012, *New England Journal of Medicine*, 366, 1190-1199; Papp 2012, *New England Journal of Medicine* 366, 1181-1189) in psoriasis highlight the role of IL-17 in the pathogenesis of this disease. As such, attenuation of IL-17 secretion from activated Th₁₇ T cells via inhibition of ROR γ may offer similar therapeutic benefit.

SUMMARY OF THE INVENTION

The invention comprises a novel class of heteroaromatic compounds and methods for making and using the same, said compounds having the general structure of formula (I), wherein the substituent groups are as herein defined:

These compounds are useful for the treatment of autoimmune and allergic disorders in that they exhibit good modulatory effect upon ROR γ .

DETAILED DESCRIPTION OF THE INVENTION

Definitions and Conventions Used

Terms that are not specifically defined here have the meanings that would be apparent to a person skilled in the art, in the light of the overall disclosure and the context as a whole.

As used herein, the following definitions apply, unless stated otherwise:

The use of the prefix C_{x-y}, wherein x and y each represent a natural number, indicates that the chain or ring structure or combination of chain and ring structure as a whole, specified and mentioned in direct association, may consist of a maximum of y and a minimum of x number of carbon atoms.

In general, for groups comprising two or more subgroups, unless otherwise indicated the last named subgroup is the radical attachment point, for example, the substituent "aryl-C₁₋₃-alkyl" means an aryl group which is bound to a C₁₋₃-alkyl-group, the

latter of which is bound to the core or to the group to which the substituent is attached. However, if a bond is depicted just prior to the first named subgroup, then that first named subgroup is the radical attachment point, for example, the substituent “-S(O)_nC₁₋₆alkyl” means a C₁₋₆-alkyl-group which is bound to an S(O)_n group, the latter of which is bound to the core or to the group to which the substituent is attached.

Alkyl denotes monovalent, saturated hydrocarbon chains, which may be present in both straight-chain (unbranched) and branched form. If an alkyl is substituted, the substitution may take place independently of one another, by mono- or polysubstitution in each case, on all the hydrogen-carrying carbon atoms.

For example, the term “C₁₋₅alkyl” includes for example H₃C-, H₃C-CH₂-, H₃C-CH₂-CH₂-, H₃C-CH(CH₃)-, H₃C-CH₂-CH₂-CH₂-, H₃C-CH₂-CH(CH₃)-, H₃C-CH(CH₃)-CH₂-, H₃C-C(CH₃)₂-, H₃C-CH₂-CH₂-CH₂-CH₂-, H₃C-CH₂-CH₂-CH(CH₃)-, H₃C-CH₂-CH(CH₃)-CH₂-, H₃C-CH(CH₃)-CH₂-CH₂-, H₃C-CH₂-C(CH₃)₂-, H₃C-C(CH₃)₂-CH₂-, H₃C-CH(CH₃)-CH(CH₃)- and H₃C-CH₂-CH(CH₂CH₃)-

Further examples of alkyl are methyl (Me; -CH₃), ethyl (Et; -CH₂CH₃), 1-propyl (*n*-propyl; *n*-Pr; -CH₂CH₂CH₃), 2-propyl (*i*-Pr; *iso*-propyl; -CH(CH₃)₂), 1-butyl (*n*-butyl; *n*-Bu; -CH₂CH₂CH₂CH₃), 2-methyl-1-propyl (*iso*-butyl; *i*-Bu; -CH₂CH(CH₃)₂), 2-butyl (*sec*-butyl; *sec*-Bu; -CH(CH₃)CH₂CH₃), 2-methyl-2-propyl (*tert*-butyl; *t*-Bu; -C(CH₃)₃), 1-pentyl (*n*-pentyl; -CH₂CH₂CH₂CH₂CH₃), 2-pentyl (-CH(CH₃)CH₂CH₂CH₃), 3-pentyl (-CH(CH₂CH₃)₂), 3-methyl-1-butyl (*iso*-pentyl; -CH₂CH₂CH(CH₃)₂), 2-methyl-2-butyl (-C(CH₃)₂CH₂CH₃), 3-methyl-2-butyl (-CH(CH₃)CH(CH₃)₂), 2,2-dimethyl-1-propyl (*neo*-pentyl; -CH₂C(CH₃)₃), 2-methyl-1-butyl (-CH₂CH(CH₃)CH₂CH₃), 1-hexyl (*n*-hexyl; -CH₂CH₂CH₂CH₂CH₂CH₃), 2-hexyl (-CH(CH₃)CH₂CH₂CH₂CH₃), 3-hexyl (-CH(CH₂CH₃)(CH₂CH₂CH₃)), 2-methyl-2-pentyl (-C(CH₃)₂CH₂CH₂CH₃), 3-methyl-2-pentyl (-CH(CH₃)CH(CH₃)CH₂CH₃), 4-methyl-2-pentyl (-CH(CH₃)CH₂CH(CH₃)₂), 3-methyl-3-pentyl (-C(CH₃)(CH₂CH₃)₂), 2-methyl-3-pentyl (-CH(CH₂CH₃)CH(CH₃)₂), 2,3-dimethyl-2-butyl (-C(CH₃)₂CH(CH₃)₂), 3,3-dimethyl-2-butyl (-CH(CH₃)C(CH₃)₃), 2,3-dimethyl-1-butyl (-CH₂CH(CH₃)CH(CH₃)CH₃), 2,2-dimethyl-1-butyl (-CH₂C(CH₃)₂CH₂CH₃), 3,3-dimethyl-1-butyl (-CH₂CH₂C(CH₃)₃), 2-methyl-1-pentyl

(-CH₂CH(CH₃)CH₂CH₂CH₃), 3-methyl-1-pentyl (-CH₂CH₂CH(CH₃)CH₂CH₃), 1-heptyl (*n*-heptyl), 2-methyl-1-hexyl, 3-methyl-1-hexyl, 2,2-dimethyl-1-pentyl, 2,3-dimethyl-1-pentyl, 2,4-dimethyl-1-pentyl, 3,3-dimethyl-1-pentyl, 2,2,3-trimethyl-1-butyl, 3-ethyl-1-pentyl, 1-octyl (*n*-octyl), 1-nonyl (*n*-nonyl); 1-decyl (*n*-decyl) etc.

By the terms propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl etc. without any further definition are meant saturated hydrocarbon groups with the corresponding number of carbon atoms, wherein all isomeric forms are included.

The above definition for alkyl also applies if alkyl is a part of another (combined) group such as for example C_{x-y}alkylamino or C_{x-y}alkoxy.

Unlike alkyl, alkenyl, when used alone or in combination, consists of at least two carbon atoms, wherein at least two adjacent carbon atoms are joined together by a C-C double bond and a carbon atom can only be part of one C-C double bond. If in an alkyl as hereinbefore defined having at least two carbon atoms, two hydrogen atoms on adjacent carbon atoms are formally removed and the free valencies are saturated to form a second bond, the corresponding alkenyl is formed.

Alkenyl may optionally be present in the *cis* or *trans* or *E* or *Z* orientation with regard to the double bond(s).

Unlike alkyl, alkynyl, when used alone or in combination, consists of at least two carbon atoms, wherein at least two adjacent carbon atoms are joined together by a C-C triple bond. If in an alkyl as hereinbefore defined having at least two carbon atoms, two hydrogen atoms in each case at adjacent carbon atoms are formally removed and the free valencies are saturated to form two further bonds, the corresponding alkynyl is formed.

Haloalkyl (haloalkenyl, haloalkynyl), when used alone or in combination, is derived from the previously defined alkyl (alkenyl, alkynyl) by replacing one or more hydrogen atoms of the hydrocarbon chain independently of one another by halogen atoms, which may be identical or different. If a haloalkyl (haloalkenyl, haloalkynyl) is to be further substituted, the substitutions may take place independently of one another, in the form of mono- or polysubstitutions in each case, on all the hydrogen-carrying carbon atoms.

Examples of haloalkyl (haloalkenyl, haloalkynyl) are $-\text{CF}_3$, $-\text{CHF}_2$, $-\text{CH}_2\text{F}$, $-\text{CF}_2\text{CF}_3$, $-\text{CHFCH}_3$, $-\text{CH}_2\text{CF}_3$, $-\text{CF}_2\text{CH}_3$, $-\text{CHFCH}_3$, $-\text{CF}_2\text{CF}_2\text{CF}_3$, $-\text{CF}_2\text{CH}_2\text{CH}_3$, $-\text{CF}=\text{CF}_2$, $-\text{CCl}=\text{CH}_2$, $-\text{CBr}=\text{CH}_2$, $-\text{C}\equiv\text{C}-\text{CF}_3$, $-\text{CHFCH}_2\text{CH}_3$, $-\text{CHFCH}_2\text{CF}_3$ etc.

Halogen relates to fluorine, chlorine, bromine and/or iodine atoms.

An isotopically-labelled form of an active agent of a combination of the present invention is identical to said active agent but for the fact that one or more atoms of said active agent have been replaced by an atom or atoms having an atomic mass or mass number different from the atomic mass or mass number of said atom which is usually found in nature. Examples of isotopes which are readily available commercially and which can be incorporated into an active agent of a combination of the present invention in accordance with well established procedures, include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine and chlorine, *e.g.*, ²H, ³H, ¹³C, ¹⁴C, ¹⁵N, ¹⁸O, ¹⁷O, ³¹P, ³²P, ³⁵S, ¹⁸F, and ³⁶Cl, respectively. The phrase “pharmaceutically acceptable” is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of

sound medical judgement, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, and commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts include those derived from pharmaceutically acceptable inorganic and organic acids and bases. Examples of suitable acids include hydrochloric, hydrobromic, sulfuric, nitric, perchloric, fumaric, maleic, phosphoric, glycolic, lactic, salicylic, succinic, toluene-p-sulfuric, tartaric, acetic, citric, methanesulfonic, formic, benzoic, malonic, naphthalene-2-sulfuric and benzenesulfonic acids. Other acids, such as oxalic acid, while not themselves pharmaceutically acceptable, may be employed in the preparation of salts useful as intermediates in obtaining the compounds and their pharmaceutically acceptable acid addition salts. Further pharmaceutically acceptable salts can be formed with cations from metals like aluminium, calcium, lithium, magnesium, potassium, sodium, zinc and the like (also see Pharmaceutical salts, Birge, S.M. et al., J. Pharm. Sci., (1977), 66, 1-19).

The pharmaceutically acceptable salts of the present invention can be synthesised from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base form of these compounds with a sufficient amount of the appropriate base or acid in water or in an organic diluent like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile, or a mixture thereof.

By a therapeutically effective amount for the purposes of this invention is meant a quantity of substance that is capable of obviating symptoms of illness or alleviating these symptoms, or which prolong the survival of a treated patient.

As illustrated in Scheme I, a suitable pyrimidine of formula A', wherein G is NH_2 , X is a

suitable group for palladium-mediated cross coupling reactions (e.g., I, Br, Cl, or OSO_2CF_3), and Y is a suitable leaving group (e.g., Cl), may be reacted with a suitable amine or amine salt (e.g., hydrochloride salt) of formula R^4NH_2 such as isopropyl amine in the presence of a suitable base (e.g., $i\text{-Pr}_2\text{EtN}$, or Et_3N) in a suitable solvent (e.g., n -butanol) and under a suitable reaction conditions such as an appropriate temperature (e.g., about 120°C) to provide a compound of formula B'. Alternatively, the said pyrimidine of formula A' wherein G is a suitable synthetic precursor for NH_2 (e.g., a nitro group) may be reacted with a suitable amine or amine salt (e.g., hydrochloride salt) of formula R^4NH_2 such as 1-methyl cyclopropylamine in the presence of a suitable reagent and solvent (e.g., $i\text{-Pr}_2\text{EtN}$ and THF, respectively), and under a suitable reaction conditions such as an appropriate temperature (e.g., about -78°C to about 25°C) to afford an intermediate, which may be converted to a compound of formula B' upon further reaction with suitable reagents (e.g., a NO_2 group that may be reduced with a suitable reagent such as SnCl_2). The selection of a suitable amine of formula R^4NH_2 and pyrimidine of formula A' for the aforementioned reaction by a person skilled in the art may be based on criteria such as steric and electronic nature of the amine and the pyrimidine. A diaminopyrimidine of formula B' may be reacted with a suitable reagent such as chloro-oxo-acetic acid ethyl ester in a suitable solvent (e.g., acetone) and in the presence of a suitable base (e.g., K_2CO_3) to furnish a compound of formula C'. A dicarbonyl compound of formula C' may be reacted with a suitable dehydrochlorinating reagent such as oxalyl chloride in the presence of a suitable additive (e.g., a catalytic amount of DMF) in a suitable solvent (e.g., CH_2Cl_2), and under a suitable reaction conditions such as an appropriate temperature (e.g., about ambient temperature) to provide a compound of formula D'. A chloro-pteridinone of formula D' may be reacted with a suitable amine or amine salt of formula $\text{R}^1\text{-W-C(R}^2\text{)(R}^3\text{)-NH}_2$ such as 4-ethanesulfonyl benzyl amine in the presence of a suitable base (e.g., Et_3N) in a suitable solvent (e.g., THF) and under a suitable reaction conditions such as an appropriate temperature (e.g., about ambient temperature) to yields a compound of formula E'. A pyrimidine of formula E' may be heated with a suitable cross-coupling partner (e.g., a boronic acid) and a suitable base (e.g., K_3PO_4), in a suitable solvent (e.g.,

1,4-dioxane), in the presence of a suitable cross-coupling catalyst (e.g., Pd(dppf)Cl₂), under suitable reaction conditions such as a suitable atmosphere (e.g., argon) and at a suitable temperature (e.g., about 100 °C) to provide a compound of formula (I).

Method 1:**Synthesis of Intermediate A**

To a stirred suspension of **A-1** (3.00 g, 18.18 mmol) in *n*-butanol (10 mL) is added **A-2** (10.80 g, 18.18 mmol) followed by DIEA (6.46 mL, 36.58 mmol). The mixture is stirred for 17 h at 120 °C. The reaction is cooled to rt and quenched by the addition of saturated aqueous NH₄Cl solution. The reaction is then diluted with EtOAc. The organic layer is separated and washed with water, followed by brine. The organic layer is dried (Na₂SO₄),

decanted and concentrated. The resultant residue is purified by SiO₂ flash chromatography to yield **A-3**.

To a stirred suspension of **A-3** (1.00 g, 5.00 mmol) in acetone (100 mL) is added ethyl chlorooxoacetate (0.88 g, 6.43 mmol) followed by K₂CO₃ (1.85g, 13.39 mmol). The mixture is stirred at rt for 18 h and the solid precipitate is isolated to yield **A-4**.

To a stirred suspension of **A-4** (1.14 g, 5.00 mmol) in CH₂Cl₂ (250 mL) is added oxalyl chloride (1 mL) followed by 5 drops of DMF. The mixture is stirred for 5 h at rt. The mixture is then concentrated at reduced pressure to yield **A-5**.

To a stirred suspension of **A-5** (0.1 g, 0.39 mmol) in THF (4 mL) is added TEA (0.16 mL, 1.16 mmol) (or DIEA), followed by **AG** (91 mg, 0.38 mmol). The reaction is allowed to stir for 18 h at rt. The reaction is quenched by the addition of saturated aqueous NH₄Cl solution and the organics are extracted with EtOAc. The organic layer is washed with water and brine, dried (Na₂SO₄), decanted and concentrated under vacuum. The resultant residue is purified by SiO₂ flash chromatography to yield **intermediate A**. MS (ES⁺): *m/z* 423.0 [M+H]⁺.

Method 2:

Synthesis of Intermediate B

To a stirred suspension of **B-1** (1.80 g, 9.30 mmol) and **B-2** (1.00 g, 9.30 mmol) in THF (10 mL) at -78 °C is added DIEA (3.29 mL, 18.59 mmol) and the reaction is allowed to slowly warm to 25 °C. The volatiles are removed under reduced pressure and the crude is redissolved in EtOAc and washed with H₂O. The organic layer is separated and washed two more times with H₂O. The organic layer is washed with brine, dried (Na₂SO₄), decanted and concentrated. The resultant residue is purified by SiO₂ flash chromatography to yield **B-3**.

To a solution of **B-3** (1.78 g, 7.79 mmol) in EtOH (50 mL) is added SnCl₂ (1.48 g, 7.79 mmol) and heated to reflux for 4 h. The reaction is allowed to cool to rt then poured over ice. The solution is treated with 1N NaOH_(aq) to bring the pH to ~9 then filtered through a pad of diatomaceous earth. The organic phase is separated and washed with H₂O followed by brine. The organic layer is dried (Na₂SO₄), decanted and concentrated. The crude product is purified by SiO₂ flash chromatography to yield **B-4**.

As an alternative procedure for the reduction of nitropyrimidine to the corresponding amino pyrimidine the following general procedure has been utilized for analogous intermediates: To a solution of the nitropyrimidine in EtOH is added catalytic RaNi. The reaction vessel is evacuated and purged with N₂(g), then evacuated and filled with H₂(g). The reaction is maintained under H₂(g) atmosphere for 15 h. The vessel is evacuated and purged with N₂(g). The reaction is filtered through a pad of diatomaceous earth to remove the Ni catalyst and the filtrate is concentrated. The resultant residue is purified by SiO₂ flash chromatography to afford the corresponding aminopyrimidine.

To a stirred solution of **B-4** (0.40 g, 2.01 mmol) in acetone (10 mL) is K₂CO₃ (0.70 g, 5.06 mmol) followed by ethyl chlorooxacetate (0.27 mL, 2.43 mmol). The reaction is stirred at rt for 24 h. The reaction is then filtered, redissolved in H₂O and extracted with EtOAc. The aqueous phase is separated and extracted two more times with EtOAc. The organic layers are combined, dried (Na₂SO₄), decanted and concentrated to yield **B-5**.

To a solution of **B-5** (0.70 g, 2.77 mmol) in CH₂Cl₂ (50 mL) is added oxalyl chloride (0.47 mL, 5.54 mmol) followed by 5 drops of DMF. The reaction is allowed to stir at rt for 18 h. The volatiles are removed in vacuo. The crude is redissolved in DCM and poured into H₂O. The organic layer is separated, washed with brine, dried (Na₂SO₄), decanted and concentrated. The resultant residue is purified by SiO₂ flash chromatography to yield **B-6**.

To a stirred solution of the **B-6** (0.83 g, 3.06 mmol) in THF (10 mL) is added DIEA (1.07

mL, 6.12 mmol) followed by **AF** (0.72 g, 3.06 mmol). The reaction is stirred at rt for 18 h. The volatiles are removed in vacuo, the crude residue is re-suspended in DCM and poured into H₂O. The aqueous phase is separated and extracted two more times with DCM. The organic layers are combined, washed with brine, dried (Na₂SO₄), decanted and concentrated. The resultant residue is purified by SiO₂ flash to yield **intermediate B**. MS (ES⁺): *m/z* 434.1 [M+H]⁺.

The following intermediates are prepared in analogous fashion:

(Note: As described in Method 34, the oxalamic acid ethyl ester intermediates generated from the reactions of A-3 (Method 1) and B-4 (Method 2) with ethyl chlorooxoacetate may be isolated and heated at a suitable temperature (e.g., 130 °C) with a suitable base, such as TEA, in a suitable solvent, such as EtOH, to afford the corresponding intermediates A-3 and B-5, respectively.)

Biological Activity

The compounds of the present invention have activity as modulators of ROR γ (retinoid acid receptor-related orphan receptor γ).

Reporter Gene Assay (RGA)

A nuclear receptor transactivation assay is performed to quantitate the ability of test compounds to inhibit ROR γ transactivation of a luciferase reporter. A similar assay is described in: Khan et al., Bioorganic & Medicinal Chemistry Letters 23 (2013), 532-536. The system uses transiently transfected HEK 293 cells cotransfected with two plasmids (pGL4.3, luc2P/GAL4UAS/Hygro, and pBIND, Gal4DBD hRORC LBD1-3). The positive control is co-transiently transfected with both plasmids, and the negative control contains the pGL4.3 promoter sequence. Assays are assembled in 384 well plates where transiently transfected cells and test compound at varying concentrations are incubated for 20-24 h. The next day, assays plates are taken out and equilibrated at RT for 20-30 minutes. Bright-Glo™ Luciferase Assay System is used to detect Luciferase production. After addition of Bright GLO detection reagent, the plates are incubated at RT for 20 minutes. The plates are read on an Envision plate reader to measure luminescence signal. The RLU signal is converted to POC relative to control and blank wells.

Methods of Therapeutic Use

On the basis of their biological properties the compounds of formula (I) according to the invention, or their tautomers, racemates, enantiomers, diastereomers, mixtures thereof and the salts of all the above-mentioned forms are suitable for treating autoimmune and allergic disorders in that they exhibit good modulatory effect upon ROR γ .

The present invention is therefore directed to compounds of general formula (I), and the pharmaceutically acceptable salts thereof, and all tautomers, racemates, enantiomers, diastereomers, mixtures thereof, which are useful in the treatment of a disease and/or condition wherein the activity of ROR γ modulators is of therapeutic benefit, including but not limited to the treatment of autoimmune or allergic disorders.

Such disorders that may be treated by the compounds of the invention include for example: rheumatoid arthritis, psoriasis, systemic lupus erythromatosis, lupus nephritis, systemic sclerosis, vasculitis, scleroderma, asthma, allergic rhinitis, allergic eczema, multiple sclerosis, juvenile rheumatoid arthritis, juvenile idiopathic arthritis, type I diabetes, Crohn's disease, ulcerative colitis, graft versus host disease, psoriatic arthritis, reactive arthritis, ankylosing spondylitis, atherosclerosis, uveitis and non-radiographic spondyloarthropathy.

For treatment of the above-described diseases and conditions, a therapeutically effective dose will generally be in the range of approximately 0.01 mg to about 10 mg/kg of body weight per dosage of a compound of the invention; preferably, from about 0.1 mg to about 5 mg/kg of body weight per dosage. For example, for administration to a 70 kg person, the dosage range would be approximately 0.7 mg to about 750 mg per dosage of a compound of the invention, preferably from about 7.0 mg to about 350 mg per dosage. Some degree of routine dose optimization may be required to determine an optimal dosing

level and pattern. The active ingredient may be administered from 1 to 6 times a day.

General Administration and Pharmaceutical Compositions

When used as pharmaceuticals, the compounds of the invention are typically administered in the form of a pharmaceutical composition. Such compositions can be prepared using procedures well known in the pharmaceutical art and generally comprise at least one compound of the invention and at least one pharmaceutically acceptable carrier. The compounds of the invention may also be administered alone or in combination with adjuvants that enhance stability of the compounds of the invention, facilitate administration of pharmaceutical compositions containing them in certain embodiments, provide increased dissolution or dispersion, increased antagonist activity, provide adjunct therapy, and the like. The compounds according to the invention may be used on their own or in conjunction with other active substances according to the invention, optionally also in conjunction with other pharmacologically active substances. In general, the compounds of this invention are administered in a therapeutically or pharmaceutically effective amount, but may be administered in lower amounts for diagnostic or other purposes.

Administration of the compounds of the invention, in pure form or in an appropriate pharmaceutical composition, can be carried out using any of the accepted modes of administration of pharmaceutical compositions. Thus, administration can be, for example, orally, buccally (e.g., sublingually), nasally, parenterally, topically, transdermally, vaginally, or rectally, in the form of solid, semi-solid, lyophilized powder, or liquid dosage forms, such as, for example, tablets, suppositories, pills, soft elastic and hard gelatin capsules, powders, solutions, suspensions, or aerosols, or the like, preferably in unit dosage forms suitable for simple administration of precise dosages. The pharmaceutical compositions will generally include a conventional pharmaceutical carrier or excipient and a compound of the invention as the/an active agent, and, in addition, may include other medicinal agents, pharmaceutical agents, carriers, adjuvants, diluents, vehicles, or combinations thereof. Such pharmaceutically acceptable excipients, carriers, or additives as well as methods of making pharmaceutical compositions for various modes or

administration are well-known to those of skill in the art. The state of the art is evidenced, e.g., by Remington: The Science and Practice of Pharmacy, 20th Edition, A. Gennaro (ed.), Lippincott Williams & Wilkins, 2000; Handbook of Pharmaceutical Additives, Michael & Irene Ash (eds.), Gower, 1995; Handbook of Pharmaceutical Excipients, A. H. Kibbe (ed.), American Pharmaceutical Ass'n, 2000; H. C. Ansel and N. G. Popovich, Pharmaceutical Dosage Forms and Drug Delivery Systems, 5th ed., Lea and Febiger, 1990; each of which is incorporated herein by reference in their entireties to better describe the state of the art. As one of skill in the art would expect, the forms of the compounds of the invention utilized in a particular pharmaceutical formulation will be selected (e.g., salts) that possess suitable physical characteristics (e.g., water solubility) that are required for the formulation to be efficacious.

All patent and non-patent documents or literature cited in this application are herein incorporated by reference in their entirety.
