

**METHOD OF LINKING A SPECIFIC WIRELESS DEVICE TO THE IDENTITY
AND/OR IDENTIFICATION MEASURE OF THE BEARER**

5

ABSTRACT

10 A method for targeting a wireless device in the vicinity of a
checkpoint, the checkpoint including at least one optionally automated
operator station, wherein the targeted device is to be correlated with the
identity of the targeted bearer of the device. Each station has at least a
wireless device identity sensor and the vicinity of each station is defined as a
bubble having a specified radius. The wireless device is part of an
authorized wireless device network. The method includes installing an
International Mobile Subscriber Identity (IMSI) catcher as a surreptitious
15 mobile tower in the midst of the authorized official network, and registering
with the network. The registration supports all the present operators in the
terminal. The method also includes moving the wireless device to one of the
bubbles prior to the bearer leaving the counter and correlating the wireless
device ID with the bearer ID.
