Abstract

Sharpening Jig with adjustable angle

The present invention relates to a sharpening jig (1), in particular for holding a cutting tool with a blade that is to be sharpened or polished, and for positioning the blade in at least one positioning angle (α) relative to a sharpening and/or polishing tool such as a rolling grinder, wherein the sharpening jig (1) comprises at least two parts (2, 3) that are adjustable relative to one another to set different positioning angles (α). To improve the compactness of the sharpening jig, the two parts (2, 3) are adjustable relative to one another along a curved path.
