- an arm;

of a user receiving tactile feedback: when moving to cradle, or when cradling, the infant's head.

8. A method of pacifying an infant characterized by the step of:

   a) using a sound system to deliver sounds to an associated auditory output device located on a palm or other part of an arm against which an infant's head can be cradled;

wherein said sound system and/or auditory output device is/are configured to enable the auditory output device to produce sound at a level which if audible to an adult cradling an infant is not audible to any other adult within a 1 meter radius of the adult.

9. A method as claimed in claim 8 wherein the sound system and associated auditory output device to produce sound at a level, which can be heard by an infant being cradled, yet cannot be heard by an adult outside a radius of substantially 30mm of the auditory output device.

~~10. An infant pacifying apparatus substantially as described herein with reference to any example and/or drawing thereof.~~

~~11. A method of pacifying an infant substantially as described herein with reference to any example and/or drawing thereof.~~
