

TWO-DIMENSIONAL CODE PROCESSING METHOD AND APPARATUS

ABSTRACT

The present application provides a two-dimensional code processing method and apparatus. The method includes: when receiving a two-dimensional code generation request sent by a two-dimensional code display client, generating static two-dimensional code information based on a user identifier carried in the two-dimensional code generation request; generating a random feature value, where the random feature value is used to limit a display feature of dynamic feature information displayed by the two-dimensional code display client; and sending the static two-dimensional code information and the random feature value to the two-dimensional code display client, so that the two-dimensional code display client displays a combinational two-dimensional code, and the displayed combinational two-dimensional code includes the static two-dimensional code information and the dynamic feature information displayed based on the random feature value. The present application improves security of applying a two-dimensional code.
