

ABSTRACT

IMAGE DISPLAY SYSTEM AND METHOD

A computer system in the present image display system inputs
5 a group of photographed images, displays a list of the group of images
on a list screen, and displays a first image selected from the group
of images on the basis of the user's operation on an individual screen.
The computer system determines an adjacent image of the first image
on the basis of determination on a spatial positional relation in
10 a pair of the first image and a candidate image on periphery thereof
and determination on an overlap state relating to the photographing
area, and selects and displays the adjacent image of the first image
on the individual screen on the basis of the user's operation.
