

Abstract

The invention relates to a method of operating a lift installation for transporting lift users in a building area, the method comprising the steps: detecting the position of lift users in the building area (S11), granting of an access authorisation of the lift users to building regions (S14), triggering of a destination call by a detected lift user (S15), allocation of a lift cage (S16) serving the destination call or lift call, boarding of a lift cage by at least one detected lift user (S17), if a lift call was triggered triggering a cage call by a detected lift user (S18), comparing whether the position of the lift user that has boarded the lift cage corresponds with the position of the lift user that has triggered the destination call (S19), and determining whether the lift user that has boarded the lift cage has an access authorisation for a destination location corresponding with the destination call or lift call (S20). Moreover, the invention relates to a lift installation for carrying out the above method.
