

ABSTRACT

Embodiments of this application provide a communication method and a communication apparatus. The communication method includes: If a preset condition is satisfied, a terminal device skips sending first channel state information CSI at first time, where the preset condition includes
5 at least one of the following: The first time does not belong to active time of a first discontinuous reception DRX and that the first time does not belong to active time of a second DRX set; the first time does not belong to active time of a first DRX and that the first time belongs to active time of a third DRX set; neither a first timer nor a second timer set is run at the first time; or a first timer is not run but a third timer set is run at the first time. In this technical solution, the terminal device
10 can report CSI when a unicast DRX and a multicast DRX coexist.
