

METHOD AND DEVICE FOR TRANSMITTING RULE FOR QOS FLOW TO DRB MAPPING

ABSTRACT OF THE DISCLOSURE

Provided are a method for a source base station to transmit a rule for Quality of Service (QoS) flow-to-data radio bearer (DRB) mapping to a target base station in a wireless communication system, and a device supporting the method. The method may comprise: a step of receiving a measurement result of a target cell, from a terminal; a step of determining handover of the terminal to a target base station, on the basis of the measurement result; and a step of transmitting a handover request message including a rule for QoS flow-to-DRB mapping of a source base station, to the target base station.
