

COMMUNICATION METHOD, APPARATUS, AND SYSTEM

ABSTRACT

This application relates to the field of wireless communication, and in particular, to cell selection and cell reselection in a wireless communication system, and provides a communication
5 method, apparatus, and system, to resolve a problem in a conventional technology that a cell selection parameter cannot match a requirement of a service rate supported by a terminal, thereby improving communication quality. The method includes: A network device determines one or more groups of values of a cell selection parameter, where there is an association relationship between the one or more groups of values of the cell selection parameter and one or more pieces
10 of service information; and the network device sends the one or more groups of values of the cell selection parameter.
