

INFORMATION PROCESSING SYSTEM AND METHOD

ABSTRACT

Embodiments of this specification provide an information processing system and method. The information processing system includes a client and a server. The server is configured to:

5 determine, based on a page loading request submitted by the client for an initial page, page loading information including loading identification information; and send the page loading information to the client; the client is configured to: update the initial page to a target page based on the page loading information; determine, in response to an operation instruction submitted for the target page, address change information including operation identification

10 information; and send, to the server, a page operation request that carries the address change information; and the server is configured to: parse the address change information carried in the page operation request, to obtain the operation identification information; and when the operation identification information is inconsistent with the loading identification information, determine blocking information associated with the target page, and send the blocking

15 information to the client, to generate a blocking reminder on the client.
