Abstract

Method for Removing Organic Pollutants in Fly Ash

A method for minimizing the concentration of toxic organic compounds in fly ash of the combustion plant takes a
5 form such that, when the specific combustion conditions are observed which lead to the formation of organic pollutants, particularly dioxins and/or furans or precursor compounds of dioxins and/or furans, the fly ash generated in the
combustion plant is returned to the combustion process so
10 that these compounds can be destroyed.
