(54) Title: PDU SET IMPORTANCE MARKING IN QOS FLOWS IN A WIRELESS COMMUNICATION NETWORK

Fig. 13

(57) Abstract: There is provided a method performed by a User Plane Function (UPF), the method comprising receiving a configuration, the configuration comprising a protocol description including one or more media stream components and at least one default PDU Set importance value; and receiving a protocol data unit (PDU) in a downlink direction wherein the received PDU is subject to PDU Set processing according to the configuration. The method further comprises determining whether: the received PDU does not match all components of the received configuration; or the received PDU does match the protocol description of the information but that the received PDU is not part of a PDU Set; and determining a PDU Set importance information value, the determination based on the at least one default PDU Set importance value. The method further still comprises creating a header for the received PDU, the header including PDU Set information and the determined PDU Set importance information value if either: the received PDU does not match all components of the received configuration; or the received PDU does match the protocol description of the received configuration, but the received PDU is not part of a PDU Set; and routing the received PDU and the header to a radio access network.
