ABSTRACT OF THE DISCLOSURE

TITLE OF THE INVENTION: DIGITAL AUDIO DATA PHASE SHIFTING APPARATUS

The timing controller receives a clock signal and a synchro signal outputted from a transmission side device, and a clock signal and a synchro signal outputted from a reception side device, and detects a writing timing of the transmission side device from these signals, thereby once storing the audio data, which is serial data, into a data storage through a serial-parallel converter, or detects a reading timing of the reception side device of the timing controller, thereby outputting the audio data stored in the data storage as serial data through the parallel-serial converter. In this constitution, adjusting deviation of phase between the devices, audio data can be transmitted.
