

ABSTRACT

The present application provides a VVN001-containing ophthalmic composition comprising an active material selected from a sodium salt represented by formula I and/or a free acid thereof, and ophthalmic excipients, to reduce the ocular inflammatory response by inhibiting a T cell-mediated inflammatory response through the active material. The concentration of the buffering agent in current invention is very low and the final buffer capacity of this ophthalmic composition is very close to the buffering capacity of the tear, which is tear-friendly and comfortable, and to increase the average residence time of the active material of the present application, as well as to increase the bioavailability of the active material represented by formula I according to the present application.

Formula I
