

ABSTRACT

Provided are a method and apparatus for displaying live broadcast data, and a device and a storage medium. The method comprises: in response to a display request for a resource, acquiring a live broadcast room identifier corresponding to the resource; determining a first live broadcast state of a live broadcast room corresponding to the live broadcast room identifier; and if the first live broadcast state indicates an on-going live broadcast, displaying, on a display interface for the resource, live broadcast data of the live broadcast room. According to the present disclosure, live broadcast data of a live broadcast room is displayed on a display interface for a resource, such that during the process of browsing the resource, when a user does not enter the live broadcast room, the user can know live broadcast related information of the live broadcast room in advance, and furthermore, the user can determine, on the basis of the known live broadcast related information, whether the user needs to enter the live broadcast room, thereby preventing the problem of a poor user experience caused by a user entering a live broadcast room which the user is not interested in when the user does not know live broadcast related information.
