ABSTRACT**A FUEL-INJECTION DEVICE IN A
TURBOMACHINE**

10 A fuel-injection device in a turbomachine, comprising a high-pressure
pump (10) supplying a flow control valve (16), whose outlet is connected via a
pressurization and cut-off valve (20) to a fuel-injector (18) feed pipe (22), the
valve (20) being connected to the inlet and to the outlet of the pump (10) in
order to define two fuel pressurization thresholds, one being used to start-up
15 and restart the turbomachine, and the other being used for operating the
turbomachine as from an idle speed and for commanding an equipment with
variable geometry (24).
