

COSMETIC COMPOSITION CONTAINING AN OLEANOLIC ACID

ABSTRACT

The present invention relates to a solubilized cosmetic composition which uses an
5 oleanolic acid entrapped in nano-liposomes as an active ingredient. The present invention can
increase percutaneous absorption of an active ingredient using nano-liposomes to promote
synthesis of collagen, thus providing a good anti-wrinkle effect. Also, since other additional raw
materials are not used for capsulation, the manufacturing cost of a product can be reduced, and a
good sensation during use can be provided.
