

COMMUNICATION METHOD AND COMMUNICATION APPARATUS

ABSTRACT

This application provides a communication method and a communication apparatus. A terminal device may report, while sending wireless network access capability information of the terminal device to a network device, indication information indicating whether a first band combination supports fallback of an uplink transmit channel switching capability. Based on the indication information, the network device may quickly and effectively determine an uplink transmit channel switching capability of a fallback band combination of the first band combination. This helps improve efficiency of configuring and/or scheduling the terminal device by the network device, and helps reduce complexity of the network device. In a process of performing communication by using the communication method and the communication apparatus, data transmission efficiency and reliability are high.
