

ABSTRACT

[ABSTRACT]

[OBJECT] To provide a nozzle hook of fueling apparatus in which a nozzle switch always operates normally; fueling work in the fueling apparatus is always performed properly; complicated work such as removal and reassembly of parts is not required; and a nozzle switch is in a position where an operator is not injured.

[SOLUTION] A nozzle hook (1) of a fueling apparatus (100) including: a nozzle hook body (2) for holding a discharge pipe of a fueling nozzle; a receiving part (3) for holding a lever guard of the fueling nozzle; a switch part (4) operated by the lever guard; a rotating member (5), when the fueling nozzle is hooked on the nozzle hook (1), to a driven gear (5A) formed on the rotating member (5) is transmitted a rotation of the switch part (4) with a drive gear (4B) formed on a back surface of the switch part (4); a driving member (6) disposed at a position away from the nozzle hook body (2), the driving member (6) driving a nozzle switch (10) attached to a housing body (101); and a connecting member (7) for transmitting a rotation of the rotating member (5) to the driving member (6).
