ABSTRACT

A CPAP apparatus (1A) includes: a first unit (100) including a first housing (110) provided with a first flow path (120) that connects a first inlet port (121) and a first outlet port (122) and in which an air blower (140) is provided; and a second unit (200) including a second housing (210) provided with a second flow path (220) that connects a second inlet port (221) and a second outlet port (222). The first flow path (120) between the first inlet port (121) and the air blower (140) is provided with a first silencer (150). The second flow path (220) is provided with a second silencer (240). In a first use state where the CPAP apparatus (1A) is used in a state where the second unit (200) is attached to the first unit (100), the second outlet port (222) is connected to the first inlet port (121). In a second use state where the CPAP apparatus (1A) is used in a state where the second unit (200) is not attached to the first unit (100), the first inlet port (121) is opened to the outside.
