ABSTRACT

INJECTION MOULDED PALLETS

A pallet is constructed from deck boards (1) and stringers (2), optionally with strengthening members (3). The deck boards (1) and stringers (2) are connected together by means of projections (4) on the deck boards (1) which are a snap-fit into apertures in stringers (2). Rotation of the deck boards (1) relative to the stringers (2) is prevented by interengagement of walls (6, 16) surrounding the projection (4) on the deck boards with transverse grooves (10) on the stringers (2) and with the side edge (11) of the stringers (2), respectively.
