

Expansion anchor

ABSTRACT

The invention relates to an expansion anchor with a bolt as a first element and with an expansion sleeve, which at least partially surrounds the bolt, as a second element, wherein the bolt has an expansion region for widening the expansion sleeve, wherein one of the two elements has a groove running in the longitudinal direction of the expansion anchor and the other element has a projection, which engages at least sectionally in the groove. According to the invention, it is provided that the groove has a narrowing, which inhibits an axial movement of the expansion sleeve relative to the bolt.
