(54) **Title:** ROUTING TRAFFIC IN AN ONLINE SERVICE WITH HIGH AVAILABILITY

Fig. 6

(57) **Abstract:** Web request routers in a cloud management system are used to route requests to content within the networks that are associated with an online service. The web request routers receive requests, parse the requests and forward the requests to the appropriate destination. The web request routers may use application specific logic for routing the requests. For example, the requests may be routed based on a document identifier and/or user information that is included within the received request. A look up table may be used in determining a destination for the request. When a location of content changes within the online service, the look up table may be updated such that the web request routers automatically direct content to the updated location. A user may also specify where their requests are to be routed.
