

ABSTRACT

METHODS AND SYSTEMS TO IDENTIFY CODE HIERARCHY BIAS IN MEDICAL PRIORITY DISPATCH SYSTEMS

A system and method assists an emergency medical dispatcher in responding to emergency calls by generating a determinant level code. A computer implemented method to determine Code Hierarchy Bias generates a determinant level sub-code that can be stored and analyzed with the determinant level code to determine the nature of Code Hierarchy Bias, to reveal hidden signs, symptoms, and conditions, to improve the accuracy and usefulness of determinant level codes, and to tailor emergency medical response structure for a more efficient use of emergency response personnel and resources.
