ABSTRACT

ENTERPRISE EGRESS ACCESS REQUESTS PROCESSING METHOD, APPARATUS, SYSTEM, DEVICE AND MEDIUM

Disclosed herein are an enterprise egress access request processing method, an apparatus, a system, a device and a medium, the method comprising: configuring a customer premises equipment in the Intranet of an enterprise, and importing an enterprise egress access request to the customer premises equipment; the customer premises equipment forwarding the egress access request to an acceleration network or sending to the acceleration network an access request complying with a preset rule in the egress access request; the customer premises equipment receiving from the acceleration network response data after performing back-to-origin server processing on the egress access request; sending the response data to a sender of the egress access request. The present application may simultaneously consider enterprise access cloud service and SaaS service experience, and deployment costs are greatly reduced compared to a dedicated line, the complexity of operation also being greatly reduced.
