

ELECTRONIC APPARATUS, INFORMATION PROCESSING PROGRAM, AND
INFORMATION PROCESSING METHOD

ABSTRACT

An electronic apparatus includes a first boot unit and a boot management unit. The first boot unit performs a first boot process for booting a first program. The boot management unit performs control of the first boot unit so as not to boot the first program in the first boot process next time when an interruption of the first boot process occurs and the interruption is caused by the first program being booted. The boot management unit does not perform the control when the interruption is caused by a factor other than the first program.
