

AUTOMATIC LOGIN METHOD AND DEVICE BETWEEN MULTIPLE WEBSITES

ABSTRACT

The present application provides an automatic login method and device between multiple websites, and the method includes the following: a server of a first website queries a login status of a user's first login account on the first website, when receiving a visit request for a target page on a second website from a user-side client; generates an automatic login token based on a token generation rule agreed by the second website, if the first login account is in a logged-in state; and creates and sends an automatic login link to the client, where the automatic login link includes a URL address of an automatic login portal of the second website and the automatic login token, so that the client visits the automatic login link to send the visit request for the target page that includes the automatic login token to the automatic login portal of the second website, and after validating the automatic login token, a server of the second website authorizes the client to perform automatic login on the second website by using a second login account bound to the first login account, and jump to the target page. The present application can improve user experience.
