

ABSTRACT

Embodiments of the present disclosure disclose access control methods and apparatuses, systems, electronic devices, programs, and medium. The method
5 includes: performing, by a camera device, video data collection to obtain video data; performing, by the camera device, face image detection on the video data; in response to a face image being detected, performing, by the camera device, authentication on the face image; and outputting, by the camera device according to whether extracted
10 feature data passes the authentication, a corresponding access control signal, so that an access control linkage apparatus opens or closes a door. Based on the embodiments of the present disclosure, the convenience and safety when a user passes through an access control are improved, the detection time is short, the detection efficiency is high, and the security of user data is improved.
