

LOWER LIMB MASSAGER

ABSTRACT

There is provided a leg massager that achieves easy changing of massaging positions and is also adaptable to user's legs of varying lengths by using a position-adjustable massaging system for performing massage on massage target areas of user's legs.

The leg massager (1) comprises: a lower massaging system (5) for massaging a massage target area of user's leg (L) including at least user's foot (F); an upper massaging system (2) for massaging an upper massage target area located above the massage target area which is massaged by the lower massaging system; a rockably supporting system (3) that supports the upper massaging system (2) for rocking motion about a horizontal-pointing axis in a front-rear direction; and a vertically moving system (4) that permits up-and-down movement of the upper massaging system (2).
