

METHOD AND APPARATUS FOR ADJUSTING TRANSMISSION POWER OF A CDMA TERMINAL

ABSTRACT

Variable gain circuits (16A,16B) are provided on an output side of spreading circuits (15A,15B) disposed for each code channel, and after the outputs from the variable gain circuits (16A,16B) are added by adders (17,18), orthogonal modulation is applied to the outputs by a modular (20), and a transmission signal is obtained. Furthermore, a variable gain circuit (22) for adjusting a level of the transmission signal is provided. An adjustment of average transmission power of the code channels is conducted by the variable gain circuit (22), and an individual adjustment is conducted by the variable gain circuits (16A, 16B).
