(54) Title: CASSETTE FOR ROTATING A LOUVRE SHUTTER

(57) Abstract: A slimline cassette assembly for rotating a louvre blade connected therewith is disclosed. The cassette assembly is capable of fitment within the stile of a frame supporting a plurality of such cassettes and an array of louvre blades connected therewith. The cassette assembly has a body for receiving a pair of straight cut mitre gears therein. The gears are located relative each other so that rotation of a first one of the gears by means of a perpendicular spline shaft connected in axial alignment therewith and extending between corresponding first mitre gears of consecutive cassette assemblies, causes rotation of the other second gear in each cassette assembly about an axis perpendicular to the axis of each first gear. Rotation of the perpendicular shaft is thus imparted uniformly to the array of louvre blades connected in axial alignment with each of the respective second gears of the cassette assemblies.
