The compounds of formula (I) are CCR2 receptor (Chemokine Receptor 2/Monocyte chemotactic protein 1 receptor) antagonists and also CCR5 receptor (Chemokine Receptor 5). Chemokines are a family of small, secreted proinflammatory cytokines functioning as chemoattractants for leukocytes. They promote trafficking of leukocytes in response to inflammatory or homeostatic signals. Chemokine orchestrate directed migration from and to vascular beds into lymphoid and peripheral tissues by establishing chemotactic gradients and activation of adhesion molecules. Chemotaxis starts upon

chemokine binding to receptors (GPCRs) by initiating signaling pathways involving increased Ca-flux, inhibition of cAMP production, rearrangements of the cytoskeleton, activation of integrins and of cell motility processes and an increase in the expression of adhesion proteins.

- 5 Monocyte Chemotactic protein 1 (CCL2) is considered to be a major chemokine mediating inflammatory processes in these diseases through the CCR2 receptor on different leukocyte subsets, in particular monocytes. In particular CCR2 and its ligands are considered to be involved in the development of atherosclerosis, peripheral vascular diseases and critical limb ischemia. There is a large body of information from animal
- 10 models of MCP-1 and CCR2 ko mice in wt or apoE^{-/-} or LDL-R^{-/-} backgrounds showing that the MCP-1/CCR2 pathway is essential for monocyte / macrophage recruitment, and also for intimal hyperplasia and the formation and stability of atherosclerotic lesions. In addition, numerous reports describe involvement of the MCP-1 / CCR2 pathway in man post injury and in various inflammatory processes, including such in vascular beds.
- 15 CCR2 is also important in diseases with inflammatory components like rheumatoid arthritis, asthma, multiple sclerosis, transplant rejection and ischemia reperfusion injury with specific prominent effects in nephropathy and peripheral vascular diseases. In addition preclinical data suggest CCR2 and its ligands are involved in the progression of the metabolic syndrome to more severe stages of obese and diabetic diseases.
- 20 CCR2 has also been linked to HIV infection, and consequently the course of autoimmune diseases, through its heterodimerization with CCR5 which has a role as coreceptor for viral entry into host cells.

Thus, CCR2 can be a target of a new medicine for treatment of the before mentioned

25 diseases.

The present invention provides the novel compounds of formula (I) which are CCR2 receptor antagonists, with some antagonist activity also at CCR5.

Compounds of formula (I) can form pharmaceutically acceptable acid addition salts. Examples of such pharmaceutically acceptable salts are salts of compounds of formula (I) with physiologically compatible mineral acids, such as hydrochloric acid, hydrobromic
 20 acid, sulphuric acid, sulphurous acid or phosphoric acid; or with organic acids, such as methanesulphonic acid, p-toluenesulphonic acid, acetic acid, lactic acid, trifluoroacetic acid, citric acid, fumaric acid, maleic acid, tartaric acid, succinic acid or salicylic acid. The term "pharmaceutically acceptable salts" refers to such salts.

"Optional" or "optionally" means that the subsequently described event or circumstance
 25 may but need not occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not. For example, "aryl group optionally substituted with an alkyl group" means that the alkyl may but need not be present, and the description includes situations where the aryl group is substituted with an alkyl group and situations where the aryl group is not substituted with the alkyl group.

30 "Pharmaceutically acceptable excipient" means an excipient that is useful in preparing a pharmaceutical composition that is generally safe, non-toxic and neither biologically nor otherwise undesirable, and includes excipient that is acceptable for veterinary use as well as human pharmaceutical use. A "pharmaceutically acceptable excipient" as used in the specification and claims includes both one and more than one such excipient.

Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed "isomers." Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers". Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other are termed "enantiomers". When a compound has an asymmetric center, for example, if a carbon atom is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R- and S-sequencing rules of Cahn, Ingold and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (i.e., as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a "racemic mixture".

The compounds of formula (I) can possess one or more asymmetric centers. Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof, as well as individual epimers and mixture thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art (see discussion in Chapter 4 of "Advanced Organic Chemistry", 4th edition J. March, John Wiley and Sons, New York, 1992).

General Synthetic Procedures

The compounds of formula (I) can be manufactured by methods known in the art, by the methods given below, by the methods given in the examples or by analogous methods.

Appropriate reaction conditions for the individual reaction steps are known to a person skilled in the art. Starting materials are either commercially available or are known or can be prepared by methods given below, by methods described in references cited in the text or by methods described in the examples, or by methods known in the art. The syntheses of the compounds of formula (I) are described in scheme 3 and 4. Schemes 1 and 2 describe the synthesis of intermediates.

Scheme 1

(In Scheme 1, R^5 , R^6 and Y are as defined before, and alkyl means C_{1-6} alkyl.)

Anilines **1** (scheme 1) are known or can be prepared by methods known in the art, *e.g.* anilines are available by reduction of the corresponding nitro compound, anilines with substituents equal to an alk-1-ynyl group can be prepared from aniline carrying bromo or iodo functions by reaction with an alk-1-yne under *Sonogashira* reaction conditions:

treatment with copper (I) iodide and tetrakis-(triphenylphosphine)-palladium(0) in piperidine between room temperature and about 100 °C. Optionally any substituent present in anilines 1 can be modified at any state of the synthesis, *e.g.* by hydrogenation of a double or a triple bond to a single bond. Hydrazines 2 are known or can be prepared
5 from anilines 1 by following *e.g.* the procedure described in Witte, John; Boekelheide, V. Journal of Organic Chemistry (1972), 37(18), 2849-53, with sodium nitrite followed by reduction with tin(II) chloride in 25% aqueous hydrochloric acid at 0 °C to RT (step a). Pyrazoles 4 can then be synthesized beginning with hydrazines 2 and beta-diketo esters 3 in aqueous acetic acid *e.g.* in analogy to Richter, Rob. Helvetica Chimica Acta (1952), 35,
10 478-85 (step b) . Beta-diketo esters 3 are commercially available or can be synthesized from reaction of the beta-keto ester with the corresponding acid chloride in the presence of anhydrous magnesium chloride and pyridine in CH₂Cl₂ at 2 °C to RT or using *i*PrMgCl in THF at 0°C.

15 Alternatively beta-diketoesters 3 can be transformed into the methyl enoethers 3a with caesium carbonate and methyl trifluoromethanesulfonate in MeCN at 2 °C to RT and can then be reacted with hydrazines 2 optionally as HCl salt in a solvent like MeOH in the presence of Et₃N at -20 °C up to RT to give pyrazoles 4. Pyrazoles 4 can also be prepared with pyrazoles 6 synthesized as described in J Jung. Tetrahedron (2002), 58, (18), 3639-
20 3639 and then subsequently coupled with bromo or iodo or chloro (in the case of heteroaryl) compounds 5 in the presence of copper iodide and cesium carbonate in DMA at 100 to 160 °C (step c).

Hydrolysis of the esters 4 with aqueous NaOH in DMSO or alcoholic solvent at RT to 40 °C gave acids 7 (step d).

Scheme 2

(In Scheme 2, R^5 , R^6 and Y are as defined before, and alkyl means C_{1-6} alkyl.)

5

Substituted acetophenones and heteroaryl ketones 11 are commercially available, known or can be prepared by methods known in the art (scheme 2). Acylation of compounds 11 with oxalate derivatives can be performed under standard conditions, e. g. with diethyl oxalate in the presence of a base like sodium ethoxide at temperatures between $-78\text{ }^{\circ}\text{C}$ and $50\text{ }^{\circ}\text{C}$ in solvents like ethanol, or with lithium hexamethyldisilazide at temperatures between $-78\text{ }^{\circ}\text{C}$ and ambient temperature in solvents like ether, to form after subsequent acidification free ethyl pyruvates 12 (step a). Alternatively, pyruvates 12 can be synthesized via i) transforming ketones 11 into the corresponding silyl enol ethers 13, e. g. through treatment with trimethylsilyl chloride in the presence of a base like triethylamine at temperatures between $0\text{ }^{\circ}\text{C}$ and $40\text{ }^{\circ}\text{C}$ in a solvent like acetonitrile (step b) and ii) in situ formation of a metal enol ether, e. g. with zinc chloride and subsequent acylation with an acylation reagent like ethyl oxalyl chloride at temperatures between $0\text{ }^{\circ}\text{C}$ and $50\text{ }^{\circ}\text{C}$ in a solvent like toluene or dichloromethane (step c). Pyruvates 12 can be converted to regioisomeric pyrazoles 15 and 16 through condensation with hydrazines H_2NNHR^6 14 which are commercially available, known or can be prepared by methods known in the art, e. g. at temperatures between ambient temperature and then reflux temperature of the solvent in solvents like ethanol (step d). Alternatively, pyrazoles 15 and 16 can be synthesized via i) reacting pyruvates 12 with hydrazine, preferably at reflux

ketones 33 with secondary amines 34 or by reductive amination of secondary amines 36 with ketones 37 (R^i , R^{ii} , R^{iii} , R^{iv} , representing substituents as described in the claims for R^1 to R^4) e.g. using sodium triacetoxy-borohydride, sodium cyano-borohydride or borane-pyridine complex as reagents in the presence of acetic acid and potentially a base like triethylamine in a solvent like halo-alkane optionally with ethanol at temperatures around RT (step c) give the final compounds I.

Newly Y substituted pyrazole I can be prepared from pyrazole I (with Y containing a bromo or iodo aryl or heteroaryl system) by methods well known in the art. *Suzuki* coupling with boronic acids in the presence of a catalyst like palladium-(II)-acetate and in the presence of tricyclohexylphosphine and a base like potassium phosphate in a solvent like toluene or *N,N*-dimethylformamide in a temperature range preferably between about 70 °C and about 130 °C. *Sonogashira* coupling was performed in analogy to Stara, Irena G.; Stary, Ivo; Kollarovic, Adrian; Teply, Filip; Saman, David; Fiedler, Pavel. Collect. Czech. Chem. Commun. (1999), 64(4), 649-672, with a reagent containing a terminal acetylene function in the presence of copper(I) iodide, tetrakis-(triphenylphosphine)-palladium in piperidine at 50 °C to 80 °C. The triple bond in the acetylenic substituent can optionally be reduced to a single bond by hydrogenation using e.g. PtO_2 or Pd/C as catalyst. Pyrazole I (with Y containing a nitro aryl or heteroaryl system) could be hydrogenated with Pd/C as catalyst and then further reacted with acid chlorides or coupled with acids in the presence of coupling reagents like HATU or EDCI (*N*-(3-Dimethylaminopropyl)-*N'*-ethylcarbodiimide hydrochloride). Optionally any substituent present in I can be modified at the ester state (ester 4 scheme 1, or ester 15 or 16 in scheme 2) of the synthesis.

Hydrazines 41 (scheme 5) are known or can be prepared by methods known in the art (see scheme 1). Hydrazine 41 can be reacted with trifluoroacetic acid anhydride to hydrazide 42 (step a) and is then further transformed with p-toluenesulfonyl chloride/N-

methyldmorpholine to the tosyl derivative 43 (step b). Following conditions described in Kiyoshi Tanaka et al. Bull. Chem. Soc. Jpn., 59, 2631 (1986), deprotonation of beta-ketoester 44 with sodium ethanolate in ethanol and reaction with tosylate 43 at 0 °C to room temperature gives pyrazole 45 (step c). Hydrolysis of the ester and coupling with the amine 46 as already described in scheme 2 and scheme 3 gives the final compound I (step d).

Alternatively hydrazone 48 was prepared from hydrazine 41 and aldehyde 47 in the presence of sodium acetate in acetic acid at room temperature to 50 °C (step e). Following literature procedure (A. S. Shawali and H. M. Hassanee, Tetrahedron, 29, 121 (1973)) hydrazone 48 can be brominated with bromine in acetic acid (step f). The corresponding bromide 49 reacts then with the deprotonated beta-ketoester 44 (sodium ethanolate in ethanol) at 0 °C to 50 °C to give pyrazole 45 (step g). Following literature procedure (Gerhard Mann et al. Synthesis, 331 (1985)) hydrazone 48 can also be reacted with beta-ketoester 44 in the presence of zinc chloride at room temperature to 170 °C (step h).

In case R⁶ contains a protected group, pyrazole 45 is an ideal intermediate for deprotection and introduction of new groups to give 45 with a new R⁶. In case R⁶ is an alkyne or furane, these groups can further be transformed to an acid and further to hetero aryl systems by methods known in the art. Hydrolysis of the ester and coupling with the amine 46 is already described in scheme 2 and scheme 3 and gives the final compound I (step i).

As described above, the compounds of formula (I) are CCR2 receptor antagonists, with some antagonist activity also at CCR5. These compounds consequently prevent migration of various leukocyte populations through the blockade of CCR2 stimulation. They therefore can be used for the treatment and/or prevention of inflammatory and/or allergic diseases, such as peripheral arterial occlusive disease, critical limb ischemia, vulnerable atherosclerotic plaque patients, unstable angina, congestive heart failure, left ventricular hypertrophy, ischemia reperfusion injury, stroke, cardiomyopathy, restenosis, rheumatoid arthritis, diabetic nephropathy, irritable bowel syndrome, Crohn's disease, multiple sclerosis, neuropathic pain, atherothrombosis and/or burns/ulcers in diabetes/CLI, and asthma.

Prevention and/or treatment of inflammatory diseases, particularly peripheral arterial occlusive diseases or atherothrombosis is the preferred indication.

The invention therefore also relates to pharmaceutical compositions comprising a compound as defined above and a pharmaceutically acceptable excipient.

The invention likewise embraces compounds as described above for use as therapeutically active substances, especially as therapeutically active substances for the treatment and/or prophylaxis of inflammatory and/or allergic diseases, particularly as therapeutically active substances for the treatment and/or prophylaxis of peripheral arterial occlusive disease, critical limb ischemia, vulnerable atherosclerotic plaque patients, unstable angina, congestive heart failure, left ventricular hypertrophy, ischemia reperfusion injury, stroke, cardiomyopathy, restenosis, rheumatoid arthritis, diabetic nephropathy, irritable bowel syndrome, Crohn's disease, multiple sclerosis, neuropathic pain, atherothrombosis, burns/ulcers in diabetes/CLI, and allergy, asthma.

The invention also relates to the use of compounds as described above for the preparation of medicaments for the therapeutic and/or prophylactic treatment of inflammatory and/or allergic diseases, particularly for the therapeutic and/or prophylactic treatment of peripheral arterial occlusive disease, critical limb ischemia, vulnerable atherosclerotic plaque patients, unstable angina, congestive heart failure, left ventricular hypertrophy, ischemia reperfusion injury, stroke, cardiomyopathy, restenosis, rheumatoid arthritis, diabetic nephropathy, irritable bowel syndrome, Crohn's disease, multiple sclerosis, neuropathic pain, atherothrombosis, burns/ulcers in diabetes/CLI, and asthma. Such medicaments comprise a compound as described above.

The invention also relates to the process and the intermediates for manufacturing the compounds of formula (I) as well as the process for manufacturing the intermediates.

CCR2 receptor antagonistic activity by the compounds of the present invention can be demonstrated by the following assays.

Receptor binding assay

Binding assays were done with membranes from CHOK1-CCR2B-A5 cells (Euroscreen) stably overexpressing the human CCR2B.

Membranes were prepared by homogenizing the cells in 10mM Tris pH 7.4, 1mM EDTA, 0.05mM benzamidine, leupeptin 6mg/L and separating the debris at 1000g. The membranes were then isolated at 100000g in 50mM Tris pH 7.4, MgCl₂ 10mM, EGTA 1mM, glycerol 10%, benzamidine 0.05mM, leupeptine 6mg/l.

For binding, CCR2 antagonist compounds were added in various concentrations in 50mM HEPES pH 7.2, 1mM CaCl₂, 5mM MgCl₂, 0.5% BSA, 0.01% NaN₃, together with 100pM ¹²⁵I-MCP-1 (PerkinElmer, 2200Ci/mmol) to about 5 fMol CCR2 membranes and incubated for 1 hour at room temperature. For unspecific control 57.7 nM MCP-1 (R&D Systems or prepared at Roche) was added. Membranes were

harvested through GF/B (glass fiber filter; PerkinElmer) plates, equilibrated with 0.3% polyethylenimine, 0.2% BSA, air dried and binding was determined by counting in a topcounter (NXT Packard). Specific binding was defined as total binding minus nonspecific binding and typically represents about 90-95% of the total binding. Antagonist activity is indicated as inhibitor concentration required for 50% inhibition (IC_{50}) of specific binding.

Calcium mobilization assay

CHOK1-CCR2B-A5 cells (from Euroscreen) stably overexpressing the human chemokine receptor 2 isoform B were cultured in Nutrient Hams F12 medium supplemented with 5% FBS, 100U/ml penicillin, 100 μ g/ml streptomycin, 400 μ g/ml G418 and 5 μ g/ml puromycin.

For the assay cells were grown overnight in 384-well black clear flat bottom polystyrene plates (Costar) at 37 °C at 5% CO_2 . After washing with DMEM, 20mM Hepes, 2.5mM probenecid, 0.1% BSA (DMEM assay buffer) cells were loaded with 4 μ M Fluo-4 in the same DMEM assay buffer for 2 hours at 30 °C. Excess dye was removed and cells were washed with DMEM assay buffer. 384-well compound plates were prepared with DMEM assay buffer / 0.5% DMSO with or without various concentrations of test compounds. Usually compounds were tested for agonist and antagonist activity.

Test compounds were added to the assay plate and agonist activity was monitored as fluorescence for 80 seconds with a FLIPR (488 nm excitation; 510-570 nm emission; Molecular Devices). After 20-30 min. of incubation at 30 °C, 20 nM MCP-1 (R&D; Roche) was added and fluorescence was monitored again for 80 seconds. Increases in intracellular calcium are reported as maximum fluorescence after agonist exposure minus basal fluorescence before exposure. Antagonist activity is indicated as inhibitor concentration required for 50% inhibition of specific calcium increases.

The compounds of general formula (I) exhibit IC_{50} values in the Ca mobilisation assay or in the receptor binding assay of 0.1 nM to 10 μ M, preferably 1 nM to 1.5 μ M for CCR2. The following table shows measured values in the calcium mobilization assay for some selected compounds of the present invention.

- The compounds of formula (I) and/or their pharmaceutically acceptable salts can be used as medicaments, e.g. in the form of pharmaceutical preparations for enteral, parenteral or topical administration. They can be administered, for example, perorally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, rectally, e.g. in the form of suppositories, parenterally, e.g. in the form of injection solutions or suspensions or infusion solutions, or topically, e.g. in the form of ointments, creams or oils. Oral administration is preferred.
- The production of the pharmaceutical preparations can be effected in a manner which will be familiar to any person skilled in the art by bringing the described compounds of formula I and/or their pharmaceutically acceptable salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

Suitable carrier materials are not only inorganic carrier materials, but also organic carrier materials. Thus, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts can be used as carrier materials for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carrier materials for soft gelatine capsules are, for example, vegetable oils, waxes, fats and semi-solid and liquid polyols (depending on the nature of the active ingredient no carriers might, however, be required in the case of soft gelatine capsules). Suitable carrier materials for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar. Suitable carrier materials for injection solutions are, for example, water, alcohols, polyols, glycerol and vegetable oils. Suitable carrier materials for suppositories are, for example, natural or hardened oils, waxes, fats and semi-liquid or liquid polyols. Suitable carrier materials for topical preparations are

glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene glycols and cellulose derivatives.

Usual stabilizers, preservatives, wetting and emulsifying agents, consistency-improving agents, flavour-improving agents, salts for varying the osmotic pressure, buffer
5 substances, solubilizers, colorants and masking agents and antioxidants come into consideration as pharmaceutical adjuvants.

The dosage of the compounds of formula (I) can vary within wide limits depending on the disease to be controlled, the age and the individual condition of the patient and the mode of administration, and will, of course, be fitted to the individual requirements in
10 each particular case. For adult patients a daily dosage of about 1 to 1000 mg, especially about 1 to 300 mg, comes into consideration. Depending on severity of the disease and the precise pharmacokinetic profile the compound could be administered with one or several daily dosage units, e.g. in 1 to 3 dosage units.

The pharmaceutical preparations conveniently contain about 1-500 mg, preferably 1-
15 100 mg, of a compound of formula (I).

The following Examples serve to illustrate the present invention in more detail. They are, however, not intended to limit its scope in any manner.
