ELEVATOR APPARATUS

An elevator apparatus having an easily mountable position detector, and capable of detecting the position of a car with good precision. The apparatus has a position detector (13), and a governor driven by a cable (8) connected to an emergency stop device mounted on a car (3) and capable of actuating the emergency stop device when the speed of the car (3) has exceeded a prescribed speed, the position detector being driven by the governor. The apparatus includes a power transmission mechanism (9, 12, 29, 39, 43A, 45, 46, 48) for increasing the speed of rotation of the governor and for transmitting rotation at an increased speed to the position detector (13).
