

Intelligent Food Cooking Machine

ABSTRACT

The present invention discloses an intelligent food cooking machine that integrates a coin device and a change return device and separates a bowl with food from a bowl storage mechanism by using a separation and fetching mechanism. A push mechanism pushes a bowl to a microwave heating mechanism for heating processing. After heating is completed, the push mechanism pushes the bowl to a delivery lifting mechanism, and then the delivery lifting mechanism delivers the bowl to a bowl dispenser opening. In this way, an intelligent food heating and selling process is implemented.
