

Abstract

The present disclosure relates to a cell reselection method, a cell reselection apparatus, and a storage medium. The cell reselection method comprises: determining location information of a terminal, wherein the location information comprises at least one of the distance between the terminal and a cell, and a geographic location of the terminal; and performing cell reselection according to the location information. According to the present disclosure, it can be accurately determined that a terminal is located at the edge of a cell, so that cell reselection can be performed in a timely manner.
