

OPTICAL CONNECTING MEMBER AND DISPLAY APPARATUS

ABSTRACT

Provided is an information processor having a lighting function, which suppresses power consumption and reduces cost. An optical coupling member (17) flexibly connects a second outputting section (14d) of a display section side light guide plate (14) and a key operating section side light guide plate (21), and guides light outputted from a white LED (13) through the second outputting section (14d) to the key operating section side light guide plate (21).
