

Abstract of Disclosure

A method for forming crinkles in cloth for a garment at almost entire portions of the garment or any desired portion of the garment without any substantial limitation from a design point of view. The method for forming a garment having crinkles which can expand and contract in both the weft and warp directions like a knitted fabric.

A cloth including thermoplastic fiber is cut into parts of the garment, the parts are sewn in a shape of the garment, the garment is overlaid on a thermo-shrinkable cloth, and they are sewn together with stitches of a water-soluble thread, the sewn cloths are heated under dry heat and without applying any pressure to the cloths so as to permit the thermo-shrinkable cloth to shrink and form crinkles in the cloth of the garment and the water-soluble thread is solved and removed, and the cloth of the garment is separated from the thermo-shrinkable cloth.
