Abstract

A detachable side collision protective block and a child safety seat provided with same. The detachable side collision safety block comprises a protective block (200) and at least one locking piece (220). The protective block (200) is removably connected to the child safety seat, and when in a connected state, protrudes from the surface of the connection position; each locking piece (220) is arranged between the protective block (200) and the child safety seat, and is used for locking the protective block (200) to the child safety seat, while also allowing for unlocking. The present detachable side collision protective block allows users to selectively install same on the child safety seat according to use requirements, such that child safety seat is adequately safe during use. When not in use, said detachable side collision protective block can be dismounted, such that the child safety seat occupies less lateral space. The side collusion protective block is convenient to use or store.
