

AGE ESTIMATION METHOD AND SEX DETERMINATION METHOD

ABSTRACT

Disclosed are novel techniques for high-precision sex
5 determination and age estimation using facial images. The
disclosed age estimation method includes: a step in which
facial image data of a subject is acquired; a step in which
spatial frequency intensities are calculated from the
acquired facial image data; and a step in which the
10 estimated age of the subject is calculated by applying the
calculated spatial frequency intensities obtained from the
facial image data.
