

## ABSTRACT OF THE DISCLOSURE

### OSCILLATION-TYPE COMPRESSOR

5 A tightly closed casing (1) has an inside space (1a) for storing coolant gas. A block (6) is accommodated in this casing. A motor (3) includes a stator (3a) and a mover (3b). A piston (5) is connected to the mover (3b) of the motor. A movable element (12) includes the mover (3b) of the motor and the piston (5). A stationary element (13) includes the stator (3a) of the motor and the block (6). An elastic element (8) has a portion (8b) fixed to the movable element (12) and another portion (8c) fixed to the stationary element (13). A  
10 cylinder (4) is shiftable in an axial direction with respect the block (6). A shifting device (16) shifts the cylinder (4) in the axial direction.
