

Figure 1

ABSTRACT

A telecommunications network for providing communications
5 links between network terminations, has switching means
(LE), two or more network terminations (TE) interconnectable
by the switching means (LE) to establish communications links
between network terminations (TE) and service control point
(SCP) for providing service to or for the network termination
10 and/or the switching means. The network has means (SSM) for
determining occurrence of a service request from a network
termination and for the switching means independent from a
request for establishment of a communications link between
network terminations.
