

Abstract

A parcel sorting system and method. The parcel sorting system comprises a parcel sorting device (100) and a parcel collecting device (101); the parcel sorting device is provided thereon with a plurality of parcel inspection inlets (104) and a plurality of parcel outlets (102), and the parcel collecting device is located just below the parcel sorting device; the parcel outlets on the parcel sorting device communicate with the parcel collecting device; the parcel outlets are respectively located at the middle or/and edges of the parcel sorting device; the parcel collecting device is provided thereon with storage devices (103) at positions under respective parcel outlets; and diameter of the storing device is larger than that of the parcel outlet. When the method is used, the parcel sorting efficiency is obviously improved; the implementation is convenient; and popularization and application are facilitated. (Fig. 4)
