METHOD AND APPARATUS FOR DETERMINING DECISION STRATEGY CORRESPONDING TO SERVICE AND ELECTRONIC DEVICE

ABSTRACT

A method and apparatus for determining a decision strategy corresponding to a service and an electronic device, the method comprising: determining multiple functions corresponding to a service; the multiple functions are used to describe a relationship between service parameters of the service and a risk evaluation value of the service, and one function is used to represent a decision strategy (S102); determining fitness of the multiple functions; the function fitness is used for representing a similarity between a decision strategy evaluation value determined on the basis of sample data and the functions and a preset decision strategy evaluation value, and the sample data includes the service parameters and the risk evaluation value (S104); and determining the functions corresponding to the service on the basis of the fitness of the multiple functions, wherein the functions corresponding to the service are used for representing a decision strategy corresponding to the service (S106).
