

Abstract

A gate lock for locking a gate bar

5 A gate lock for locking a gate bar, comprising a generally U-shaped body including a bar and having spaced-apart first and second legs provided with holes in which a bolt-like shackle is slideably engaged, the shackle having a locking end which is lockable by a key-operated lock mechanism which is arranged
10 within the first one of the legs, the U-shaped body and the shackle defining a locking recess for the gate bar to be locked, the bar being divided into two bar members slideably connected via a splined connection, wherein the splined connection is a swallow-tail-shaped slide which has its
15 longitudinal direction running transverse to the shackle.
