

ABSTRACT

The embodiments of the application provide a method and apparatus for detecting tokens on a game table, a device, and a storage medium. The method includes that: in a case where a game played on a game table enters a payout stage, at least one frame of game image of the game is acquired; a target region where a token is changed in multiple regions for token placement on the game table is determined based on the at least one frame of game image, the target region being a region representing that a game result is win and/or a region representing that a game result is loss; an operating object associated with the changed token in the target region is determined; and in a case where the operating object associated with the changed token is a gamer of the game, target alarm information for the operating object is output.
